

Pressure Vessel PVQ

Pressure vessels are broadly used across many industries including refining and petrochemical applications. Due to the critical nature of processes involved, all pressure vessel quality (PVQ) material is order to ASME / ASTM specifications and is provided with 100% traceability to Material Test Reports (MTR's). To accommodate specific operating environments we perform special testing to simulate operating conditions – per customer specifications (such as testing to API 934 practice). For low to intermediate operating temperatures we offer our SA 516 Gr 60, SA 516 Gr 65, and SA 516 Gr 70 material. As the temperatures increase in some environments we provide SA 204 (carbon / moly) material for the lower temperature range and for more elevated ranges our SA 387 Gr 11 and SA 387 Gr 22.
